

Your Gas Meter Needs to Breathe, Too

Once again, the winter season is providing the challenge of keeping gas meters and regulators clear of snow and ice. If your meter or regulator - a small, circular device with a vent - freezes or is covered with snow or ice, the equipment may not operate properly. This may cause a safety hazard by causing the flow of gas into your home to become irregular.

A meter blocked by snow also makes it difficult for our meter reader to obtain a reading. This may lead to an estimated bill.

You can help. Please keep your meter area clear of snow this winter. Also, please be very careful when using power equipment around your meter.

***Remember, your meter needs
to breathe, too.***
